

EIA-Short-Term Energy Outlook – Highlights

- This edition of the Short-Term Energy Outlook is the first to include forecasts for 2014.
- EIA expects that the Brent crude oil spot price, which averaged \$112 per barrel in 2012, will fall to an average of \$105 per barrel in 2013 and \$99 per barrel in 2014. The projected discount of West Texas Intermediate (WTI) crude oil to Brent, which averaged \$18 per barrel in 2012, falls to an average of \$16 per barrel in 2013 and \$8 per barrel in 2014, as planned new pipeline capacity lowers the cost of moving Mid-continent crude oil to the Gulf Coast refining centers.
- EIA expects that falling crude prices will help national average regular gasoline retail prices fall from an average \$3.63 per gallon in 2012 to annual averages of \$3.44 per gallon and \$3.34 per gallon in 2013 and 2014, respectively. Diesel fuel retail prices averaged \$3.97 per gallon during 2012 and are forecasted to fall to an average of \$3.87 per gallon in 2013 and \$3.78 per gallon in 2014.
- EIA estimates U.S. total crude oil production averaged 6.4 million barrels per day (bbl/d) in 2012, an increase of 0.8 million bbl/d from the previous year. Projected domestic crude oil production continues to increase to 7.3 million bbl/d in 2013 and 7.9 million bbl/d in 2014, which would mark the highest annual average level of production since 1988.
- Total U.S. liquid fuels consumption fell from an average 20.8 million bbl/d in 2005 to 18.6 million bbl/d in 2012. EIA expects total consumption to rise slowly over the next two years to an average 18.8 million bbl/d in 2014, driven by increases in distillate and liquefied petroleum gas consumption, with flat gasoline and jet fuel consumption.
- Natural gas working inventories, which a record-high level in early November, ended 2012 at an estimated 3.5 trillion cubic feet (Tcf), slightly above the level at the same time the previous year. EIA expects the Henry Hub natural gas spot price, which averaged \$4.00 per million British thermal units (MMBtu) in 2011 and \$2.75 per million MMBtu in 2012, will average \$3.74 per MMBtu in 2013 and \$3.90 per MMBtu in 2014.
- EIA expects the coal share of total electricity generation to rise from 37.6 percent in 2012 to 39.0 percent in 2013 and 39.6 percent in 2014, as natural gas prices rise relative to coal prices. Lower-than-projected natural gas prices along with the industry's response to future environmental regulations could cause the coal share of total generation to fall below this forecast. <http://www.eia.gov/forecasts/steo/>

NOTE: The Vermont Fuel Price Report is published monthly by the Vermont Department of Public Service. Prices are collected on or about the first Monday of each month and reflect dealer discounts for cash or self-service, except propane prices, which are an average of the credit and discount price. Propane prices are based on 1,000 + gallons. For more information please contact Mike Kundrath at (802) 828-4081 or by email at michael.kundrath@state.vt.us.

Vermont Fuel Prices -One-Year Trend

Vermont Average Retail Petroleum Prices (per gallon)					
	Jan'13	Dec'12	%change	Jan' 12	%change
No. 2 Fuel Oil	\$3.825	\$3.805	0.53%	3.838188	-0.34%
Kerosene	\$4.244	\$4.187	1.36%	4.244519	-0.01%
Propane	\$3.068	\$2.974	3.15%	3.259056	-5.86%
Reg. Unleaded Gasoline	\$3.584	\$3.668	-2.30%	3.487125	2.78%
Diesel	\$4.231	\$4.229	0.04%	4.169909	1.46%

Vermont Historical Weather and Degree Day Data

CDD's are used during summer months to compare the current day's average temperature against the 65°F standard to determine the energy demands of cooling your home through air conditioning or fans. For example, if the current day's high is 85°F and the low is 65°F, the day's average temperature will be 75°F. Since 75°F-65°F is 10°F, this day would have 10 cooling degree days. Adding the degree days together for the whole month provides a way to compare previous months or years.

•HDD's are used the same way during winter months to determine the energy demands of heating your home. The 65°F standard still is used, however, the day's average temperature is subtracted instead of added to the standard. For example, if the current day's high is 30°F and the low is 10°F, the day's average temperature will be 20°F. Since 65°F-20°F is 45°F, this day would have 45 heating degree days. Just like cooling degree days, heating degree days may be added together for the entire month to compare to previous months or years.¹

Annual Total	6221	849	7070	5664	860	6524	-9%	1%	-8%

The primary online source for historical weather and degree day data is the available from the NOAA - National Climatic Data Center (NCDC) web site at:

<http://www7.ncdc.noaa.gov/CDO/CDODivisionalSelect.jsp#>

NCDC maintains the world's largest climate data archive and provides climatological services. Records in the archive range from paleoclimatic data to centuries-old journals to data less than an hour old.

Another source is the Weather Data Depot web site. The data collection is not as extensive as the NOAA collection only covering the years from 1993 forward. But the site is more user friendly.

http://www.weatherdatadepot.com/?pi_ad_id=8426228665&gclid=ClazvMf8krQCFQqk4AodFRYArQ

A negative percentage means the Comparison Year was milder than the Base Year. A positive percentage means the Comparison Year was more severe than the Base Year. When the monthly degree days in either the base year or the comparison year are less than 30, a percentage comparison is not calculated. However, the Annual Total comparison percentages include all heating and cooling degree days.
